

WELCOME TO YOUR METAVERSE-

AI AND AR-ENABLED NEXT GENERATION APPLICATIONS AND SERVICES

Albena Mihovska, PhD
Associate Professor
Aarhus University, BTECH, CGC

CONASENSE workshop

04-05/10/2021
FORTISS,
Munich, Germany

DEPARTMENT OF BUSINESS DEVELOPMENT
AND TECHNOLOGY
AARHUS UNIVERSITY

ALBENA MIHOVSKA
ASSOCIATE PROFESSOR

OUTLINE

- About CTIF Global Capsule (CGC)
- Technology Trends
- Disruptive Technologies
 - AI
 - 6G enabling technologies
- Key Metaverse Elements
- Conclusions

ABOUT CGC

Basic and applied research in Technology and Multi Business Model Innovation through a global collaborative, cross-/interdisciplinary academic research and industry network

<https://ctifglobalcapsule.org>

6G technology, Healthcare & Entrepreneurship, AI and digitalisation of Business Models.

DEPARTMENT OF BUSINESS DEVELOPMENT
AND TECHNOLOGY
AARHUS UNIVERSITY

ALBENA MIHOVSKA
ASSOCIATE PROFESSOR

HOW IS TECHNOLOGY CHANGING OUR WORLD

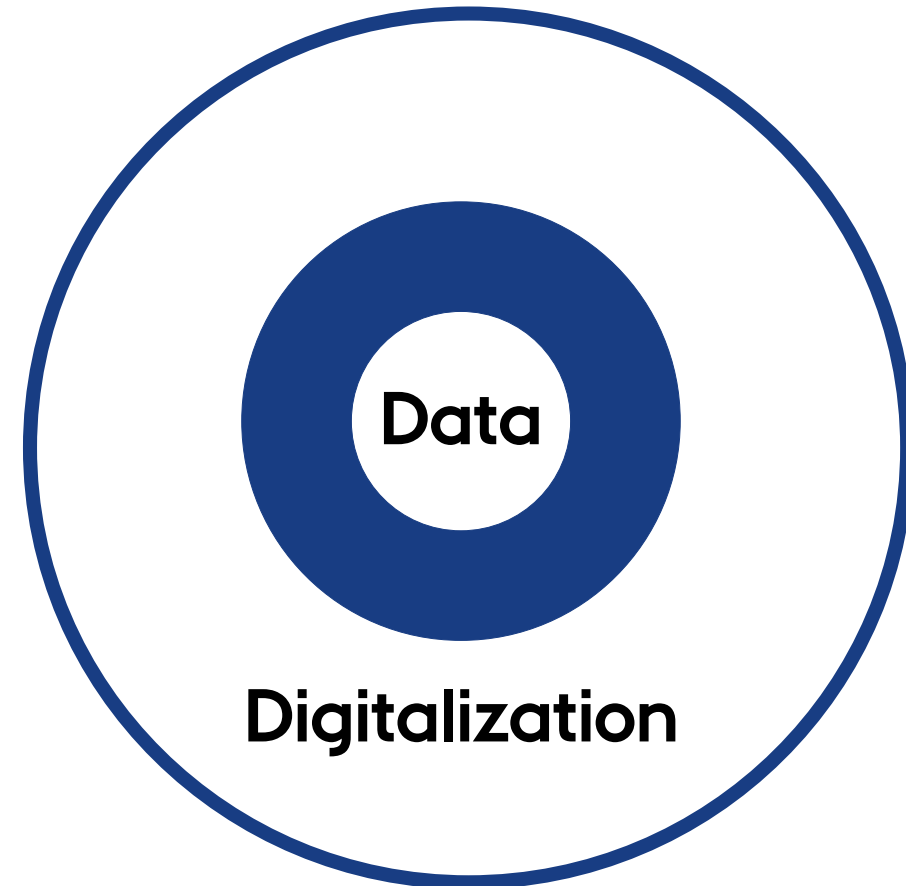

- From universal to metaversal communications

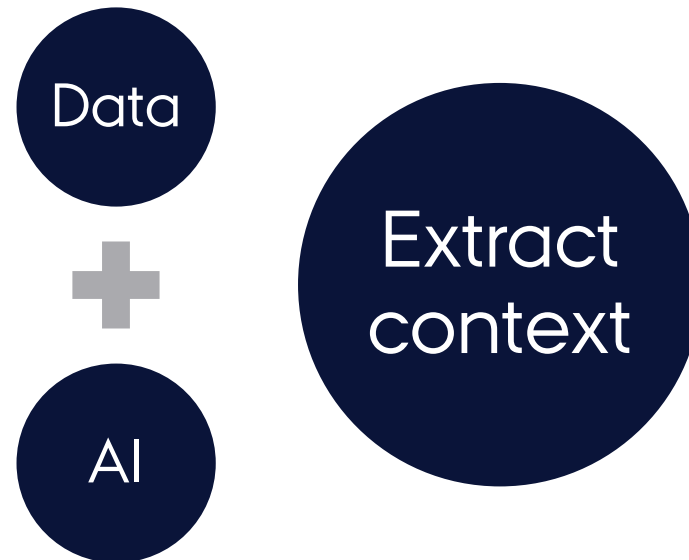

DISRUPTIVE TECHNOLOGIES

Artificial Intelligence (AI)-

- Better performance
- Cost-efficiency
- Increased number of services

ARTIFICIAL INTELLIGENCE (AI)

A solution is only as good as the data and how well it has been trained

WHAT HAS CHANGED?

- **Advanced services and applications**

- Augmented, mixed, extended reality (AR, MR, XR)
- High-fidelity and real time mobile hologram
- Digital twins

- **New types of users**

- Humans
- Machines

- **New set of requirements**

- Performance
- Design
- Trustworthiness

- **Key driving technologies**

- Advanced sensors,
- Artificial intelligence
- Communication technologies

KEY METAVERSE ELEMENTS

- Truly immersive XR (Wireless capacity (0.44 Gps throughput compared to current 55.3 Gpbs for AR); User experienced data rate for XR streaming (0.9Gps throughput))
- High-fidelity mobile hologram
- Invisible-to-visible (digital avatar)

NETWORKING IN THE METAVERSE

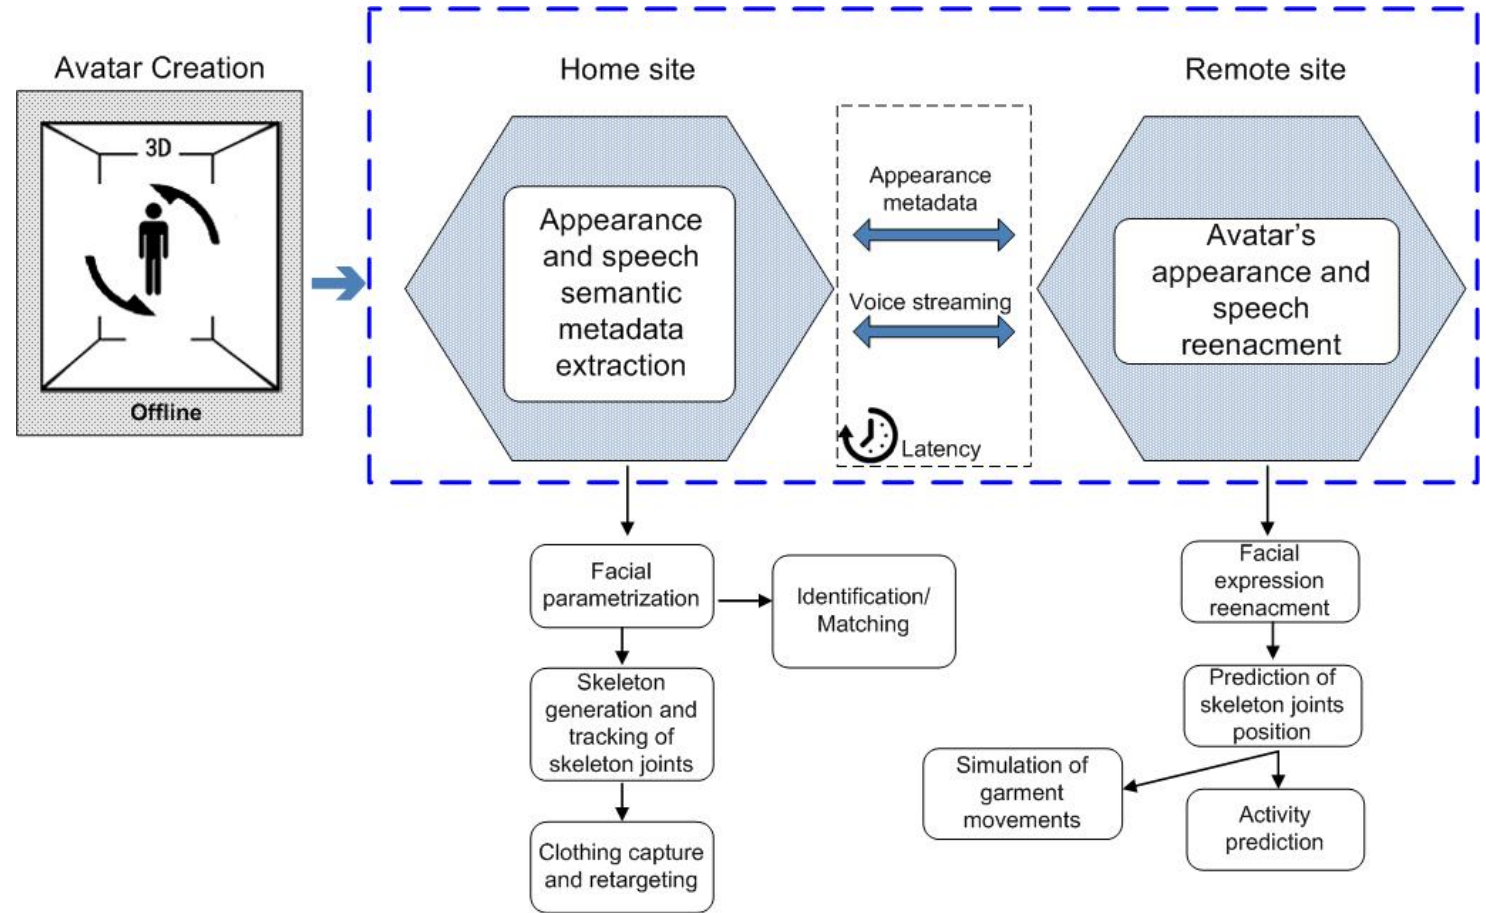

- Bandwidth:
 - Cloud-based data streaming
- Latency:
 - the hardest and slowest to fix of all network attributes
- Reliability

CAN WE GET THERE?

Typical Scenarios	Performance Requirements	Enabling Technologies	Design Principles	Applications
Further-enhanced mobile broadband (FeMBB)	<ul style="list-style-type: none"> Peak data rate > 1 Tb/s User experienced data rate > 1 Gb/s Area traffic capacity > 1 Gps/sq.m Spectrum efficiency 5-10x 	THz communications Block-chain based spectrum sharing; SM-MIMO; VLC	Higher and unlicensed frequency bands; Richer spectrum resources; Strong security	Real-time holograms, full sensory digital reality; tactile applications
Long-distance and high-mobility communications (LDHMC)	<ul style="list-style-type: none"> Mobility > 1000 km/h 	Large-dimensional networks	Improve wireless coverage	Space travel; deep-sea communications
Ultra-massive machine-type communications (umMTC)	<ul style="list-style-type: none"> Latency: 10-100μs High connectivity density: 10^7 km/sq.m Energy efficiency 10-100x 	THz communications Block-chain based spectrum sharing; SM-MIMO; VLC; holographic beamforming; AI	Parallel data streams for higher spectral efficiency; High data transmission reliability; improved energy efficiency Strong security;	Internet of Everything; Smart city/Knowledge home
Extremely ultra-reliable and low-latency communications (eURLLC)	<ul style="list-style-type: none"> Latency: 10-100μs High connectivity density: 10^7 km/sq.m Mobility > 1000 km/h 	AI, SM-MIMO, quantum communications and computing	Autonomous and zero-touch networks; improved computer efficiency	Industrial IoT, fully autonomous driving
Extremely Low Power Communications (ELPC)	<ul style="list-style-type: none"> High connectivity density: 10^7 km/sq.m Energy efficiency 10-100x 	Molecular communications and Internet of Nano Things	Nano-scale communications and connectivity	E-Health, nano-communications

HIGH-FIDELITY MOBILE HOLOGRAM

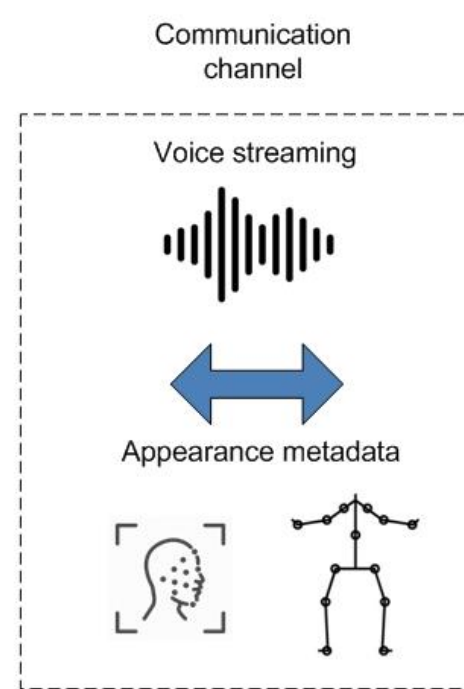

- real-time capture,
- transmission,
- 3D rendering techniques,
- extremely high data rate transmission

Conceptual architecture for a context-aware holographic communication system based on semantic knowledge extraction.

ENTERING THE METAVERSE

Conceptual model of the Bee-cube environment for holographic communication including all sensors deployment for two-way communication where participants from both locations wear VR/AR glasses and data is shared.

CONCLUSIONS

- The future ahead is a fully realized digital world
- Extreme connectivity is a main enabler and driver
- Seamless integration of different technologies, services, capabilities and products
